

Felipe Farias Escobar

Mid-Level Software Engineer

Santiago, Chile

felipe.farias.e1@gmail.com | LinkedIn.com/in/FelipeFa6 | Github.com/FelipeFa6

PROFESSIONAL SUMMARY

Software Engineer with 4 years of experience building backend systems from scratch in **Go** and **Python**, with production solutions in the healthcare and energy sectors.

PROFESSIONAL EXPERIENCE

Mid-Level Software Engineer

June 2025 – July 2026

INDRA

Hybrid

- Maintenance of **Go** microservices and tickets across a varied stack (**Python**/Django, **TypeScript**/NestJS and React, **AWS**), contributing to **architecture**, **code review** and query optimization. Microservice deployments on **GCP** (Compute Engine) with machine administration over SSH.
- Implemented the **Data Quality** solution alongside the data architect: validation rules, verification routines and **event saga** listeners (Java/Quarkus, Python). Data quality from **75% to 98%** at the **Coordinador Eléctrico Nacional** (Chile's national grid operator), externally validated.

Software Engineer

January 2024 – June 2025

National Cancer Institute (Chile)

On-site

- Proposed, designed and built from scratch the **Integrador**, a concurrent orchestrator in **Go** that synchronizes **4 Oracle databases** of isolated clinical systems, processing requests from an **external vendor's API** as they arrive through its own **Gin HTTP** endpoints. **Still in production**.
- **Event saga** pattern with **compensation** on partial failures, rolling back databases already updated; **retries with queueing** persisted in the database, and per-saga state recorded for **auditing**. Concurrency with **goroutines**; **unit and integration tests** with **testify**.
- Enabled **FHIR** interoperability with the North Metropolitan Health Service via **Mirth Connect**, eliminating manual data updates in production.
- **CI/CD** with **Git Hooks** and migration to **Docker** (deployment from **1 hour to 5 minutes**); **Linux/Apache** administration and legacy **PHP 5.7/CodeIgniter 3** migrated to **PHP 8/Laravel**.

Junior Software Developer

July 2022 – December 2023

Coolebra

Remote

- Built from scratch an **ETL** in **Python**, with **no external dependencies**, auditing **200,000 products daily** from **PostgreSQL** into **OpenSearch** with price history, in **2 hours** across **5 machines** (**Terraform**).
- Scaled **scraping of 30+ retailers** (BeautifulSoup, Selenium) using **reverse engineering** across **3 EC2 instances**, and deployed OpenSearch as a service.
- Front-end in **React**: landing page and products section with searches against OpenSearch; **Mercado Pago** for subscriptions.

Teaching Assistant, Object-Oriented Programming III and Databases

November 2021

INACAP

On-site

- Taught inheritance and object-oriented modeling in **Python** and relational databases.

CURRENT PROJECT

Petfi.io | Social platform for animal rescue and adoption

March 2026 – Present

- Platform with over **11,000 active users**. Web application in **Flutter**, including the admin panel and its role system, on **Firebase** (Firestore, Auth, Storage, Messaging, Hosting) with security rules and composite indexes.

EDUCATION AND CERTIFICATIONS

INACAP | B.Eng. in Computer Engineering | Degree 2023

2019 – 2022

University of Helsinki | Full Stack Open, core course

2024

Oracle | OCI 2025 Certified Foundations Associate

2026

TECHNOLOGIES

Languages: Go, Python, TypeScript, JavaScript, SQL

Back-end and Data: Gin, NestJS, Django, FastAPI, Oracle/PL-SQL, PostgreSQL, OpenSearch, Firestore

DevOps: AWS (EC2), GCP (Compute Engine, Firebase), Docker, Terraform, CI/CD, Git Hooks, Linux

Patterns: Event Saga with compensation and retries, goroutines, microservices, ETL, systems integration, FHIR
